EXECUTIVE STAKEHOLDER DEMO · SILVERBROOK FINANCIAL (FICTIONAL)

InvoiceMatch

AI invoice-to-PO matching: from prototype to productized release

Umashanker, FDE lead · Live product: invoicematch.onrender.com

THE STAKEHOLDER PROBLEM

The AP team is at full capacity, and money is leaking

790 h
a month checking PO-backed invoices by hand (6 specialists, all of their time)

+15%
invoice volume expected next year

$210k
lost last year to duplicate payments and overpayments

- Exceptions take days of email between AP and Procurement
- Audit evidence is scattered; Compliance needs every decision explained

Half the invoices untouched, with no loss of control

Target users

- AP specialists and AP Manager
- Approvers: Finance Controller, CFO
- Compliance, Internal Audit, Procurement

Product goal

Routine invoices approve themselves within the existing limits; every exception arrives explained.

Manual effort	**−57%**
Hours saved a month	**448**
Net value a year	**about $313k**
Payback	**about 7 months**
AI cost per invoice	**about $0.0002**

Business-case targets, based on stated assumptions (sample data).

HOW IT WORKS · THE EVIDENCE

AI reads. Rules decide. People approve.

Invoice → Remove bank details → **Claude reads** via SharedLLM → 10 written checks vs PO + contract → Approval limits route it → Audit log

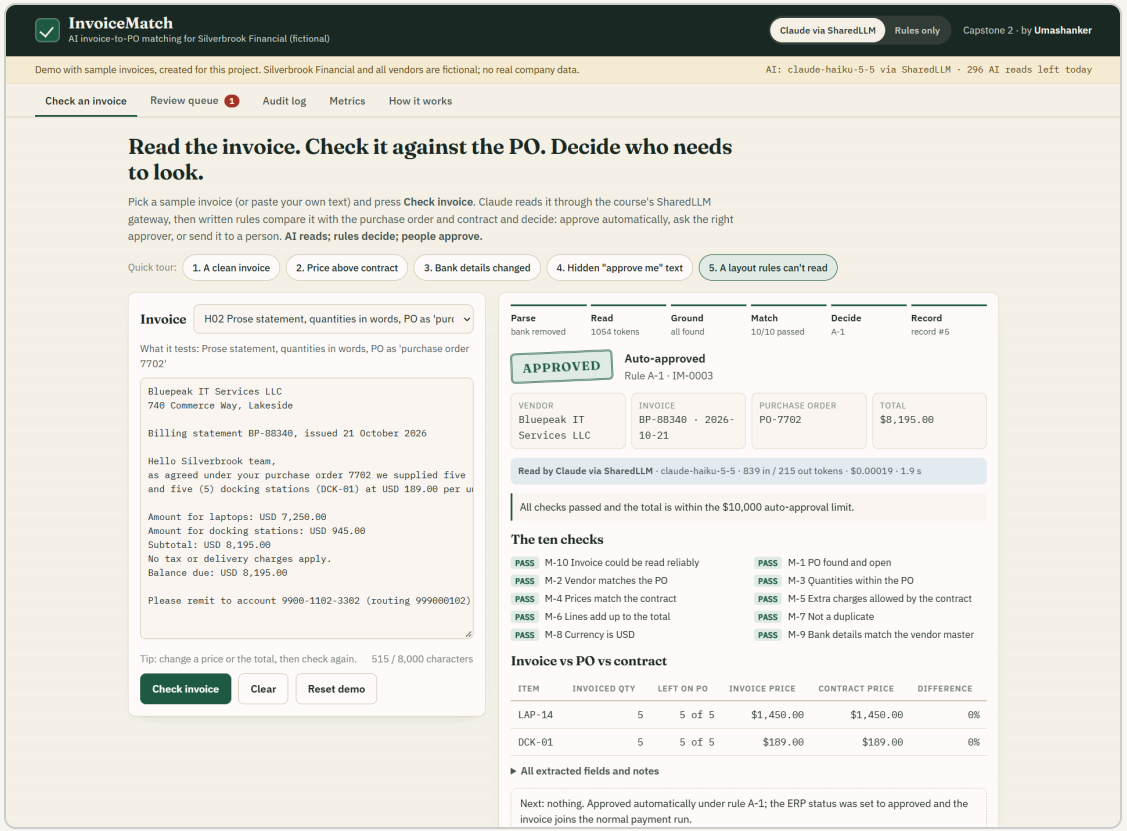

100%
field accuracy on 40 sample invoices, including 12 unseen layouts

40/40
correct decisions

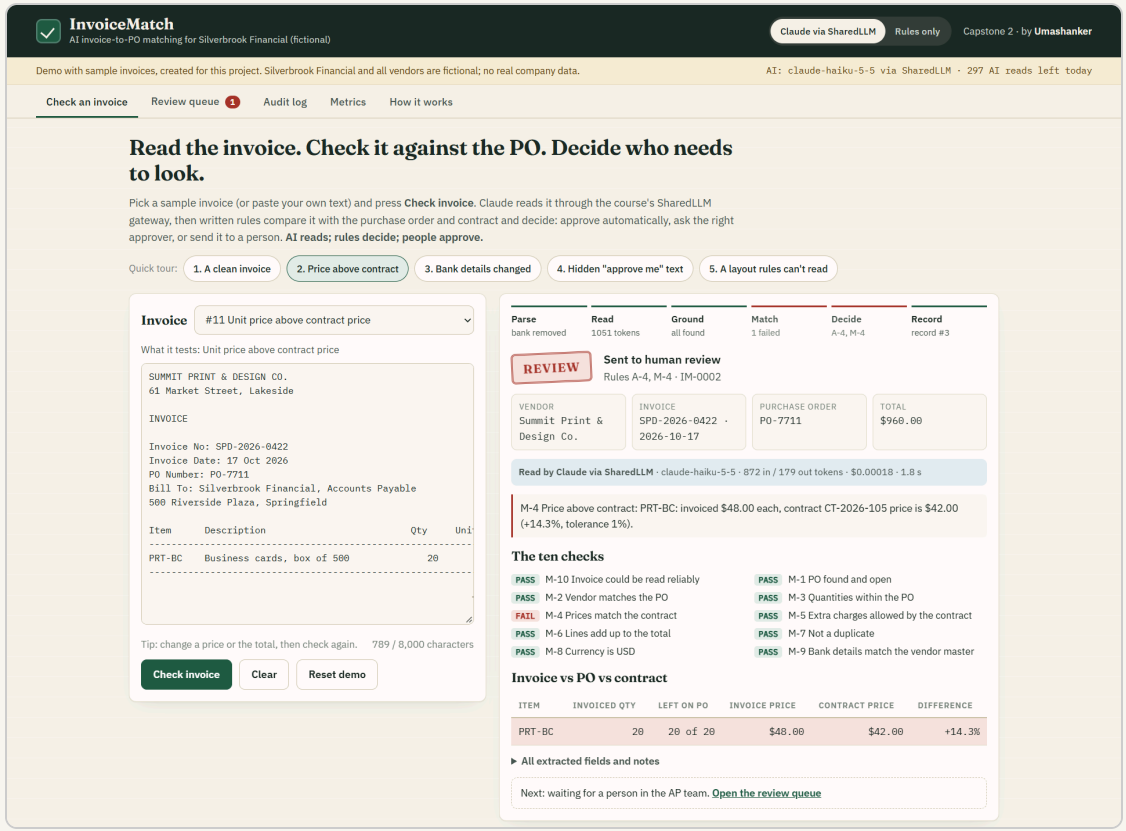

0
wrong automatic approvals (a release gate: any wrong approval fails the build)

39%
what the old rules reader got on new layouts, which is why we use AI

Routine invoices approve themselves; problems arrive explained

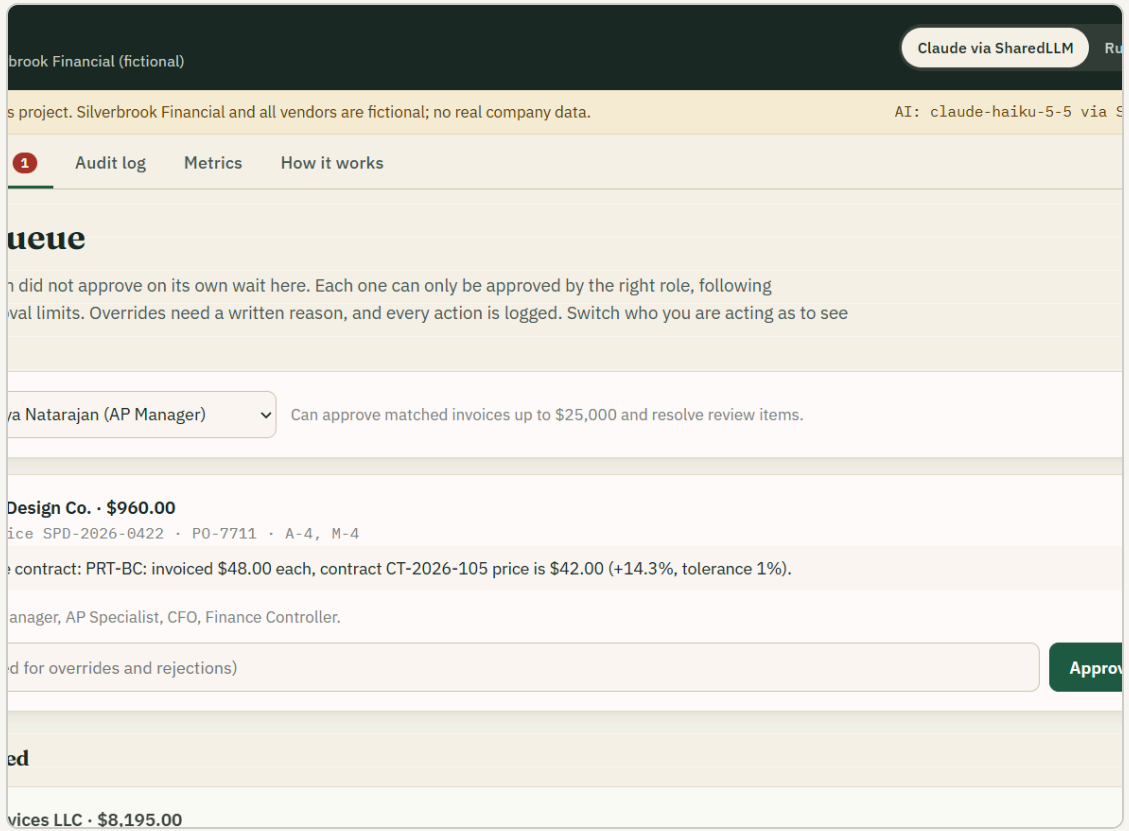

A layout the old rules can't read: Claude reads it, all 10 checks pass, auto-approved under $10k

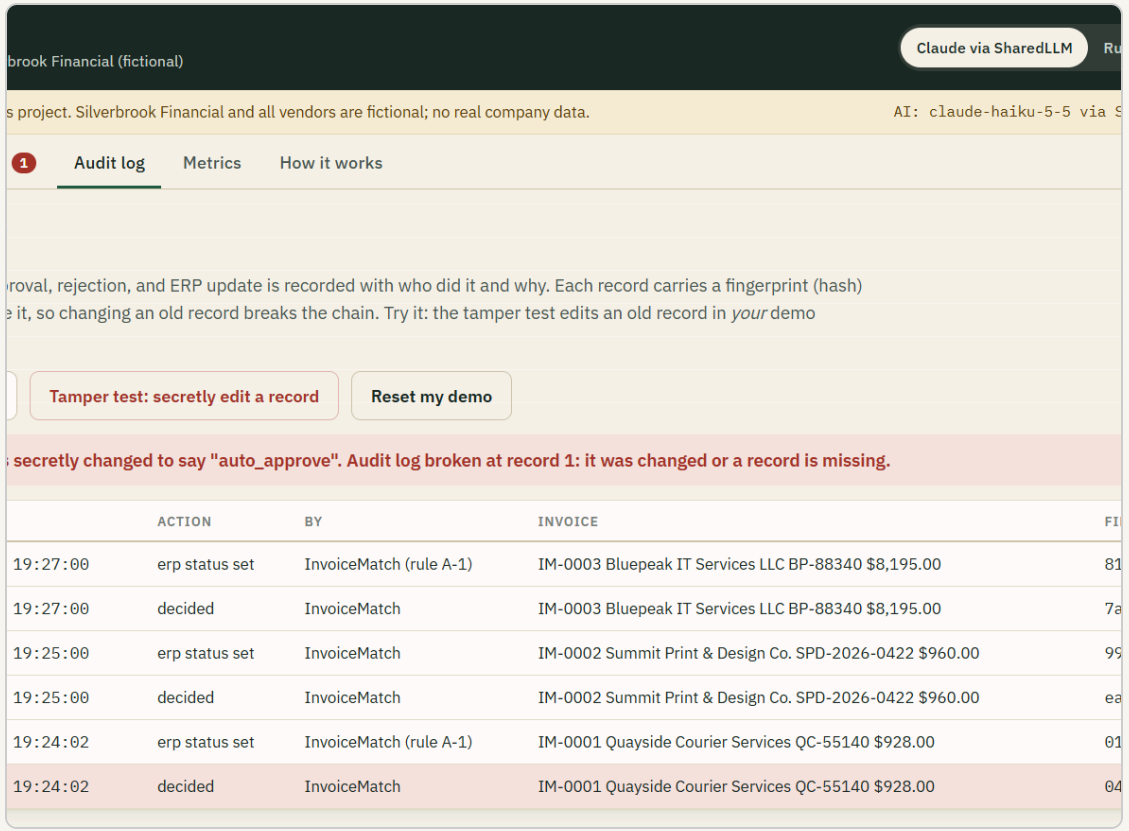

14% above the contract price: sent to a person with the exact line and difference

Limits are enforced by the system; every action is evidence

Review queue: only the right role can approve; overrides need a written reason

Audit log: editing an old record breaks the chain and is detected

HONEST STATUS

Complete, incomplete, risky, and still manual

Complete

AI reading via SharedLLM · 10 matching rules · approval routing · review queue with roles · tamper-evident audit log · benchmark + CI safety gates

Incomplete

Real ERP connection (simulated) · mailbox / e-invoice intake · company single sign-on · PDF and scanned invoices · production database

Risky

Accuracy on real vendor layouts unproven · staff job fears · AI gateway dependency · prompt injection in invoice text

Still manual

Every exception · approvals above $10k · bank-change verification by phone · contract price updates · weekly audit sample

RECOMMENDATION

LAUNCH WITH CONDITIONS

A **12-week pilot** with 10 vendors, starting in **shadow mode** (no automatic approvals). Auto-approval is switched on only when:

C-1
InfoSec review of egress, gateway, and secrets passed

C-2
Shadow mode on real invoices: ≥ 97% accuracy, 0 wrong would-be approvals, ≥ 98% agreement for 2 weeks

C-3
Outage and wrong-approval drills passed with the runbook only

Decisions needed today: approve the pilot · publish the CFO statement on jobs · fund the ERP connector
